Reusable Vinyl Balloon Inflation Tips

Thanks for choosing Great American's Reusable Vinyl Balloons!

Every balloon undergoes a rigorous quality control process, ensuring your displays always look their best. We inflate each balloon to the intended size before the vinyl cools down so each balloon will be able to re-inflate to, at least, the noted size, if not larger.

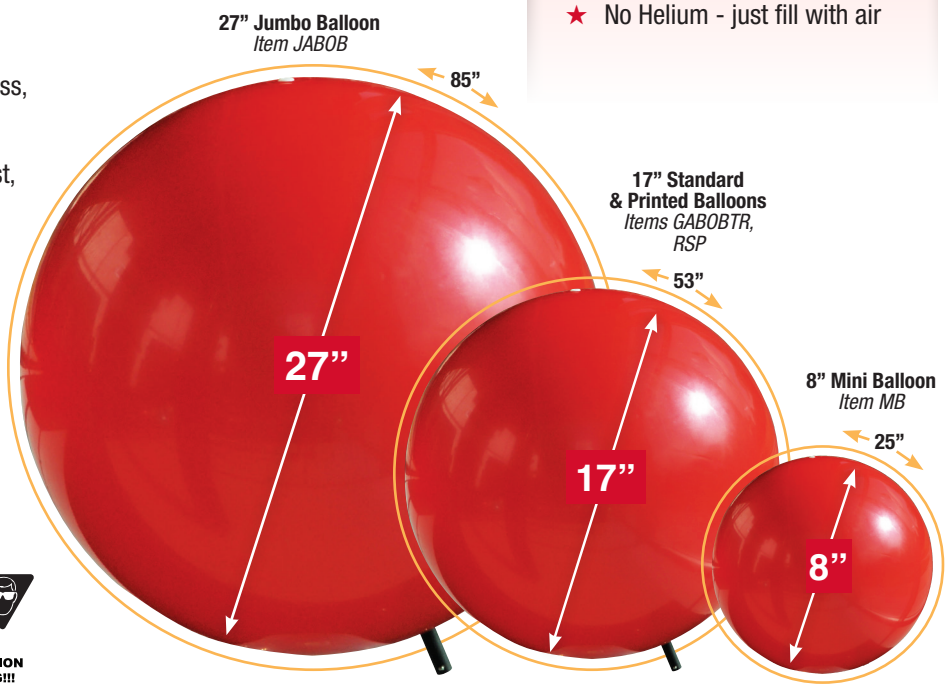
This process may cause some variation in the stretch and inflation speed, which is normal, and ensures each balloon can re-inflate to its' intended size. Please note that a 20° temperature variance may cause a slight deflation.

- *Slight size variations may occur between balloons.*
- *Setting up a day early is suggested for sizing adjustments and wrinkle removal.*

Use the guide below for consistent sizing when inflating multiple balloons.

GREAT AMERICAN'S EXCLUSIVE HELIUM-FREE BALLOONS:

- ★ Guaranteed to last 90 days or your money back
- ★ Durable for Outdoor Use
- ★ UV-resistant vinyl won't fade
- ★ No Helium - just fill with air

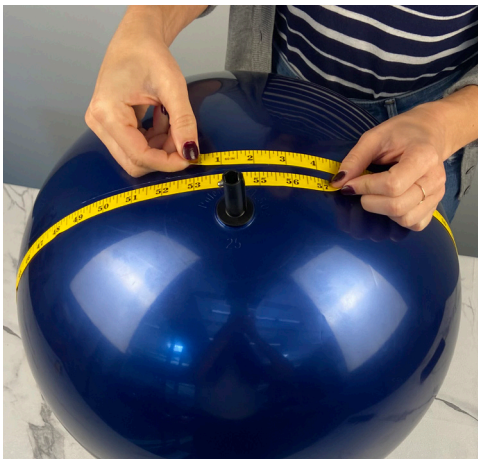


STEP 1. Remove the air plug from the top of the balloon to inflate. Inflate using a hand air pump or an air compressor with a tapered fill nozzle tip.

Note: *Great American's* ***Item COMPRESSOR*** *is compatible with all of Great American's reusable balloons.*

STEP 2. Reinsert air plug into inflation hole after balloon is inflated. Be careful not to overinflate.

The ideal circumference for each size:
8" Mini Balloons = 25"
17" Standard Balloons = 53"
27" Jumbo Balloons = 85"



STEP 3. Measure the circumference (full outside surface in the middle) of the balloon. If it is larger than the ideal, let out a little air until it hits the mark. If your balloon is smaller, keep inflating. The vinyl may feel tight, but there should be more than enough give to reach it's full size.
